Geophysical Abstracts 1979 was published in six issues and includes 2553 abstracts. This index completes the 1979 volume.

ISSN 0309-4332

USING THE INDEX

This subject index has been designed to allow rapid search without any need to refer to a long classification code. It will be seen to have some similarities with the common KWIC (Keyword in context) type of computer index, although it departs from the KWIC by placing the index word in the conventional left-hand position. By means of words chosen from the title or the body of the abstract, each item is indexed an average of about 7 times. As all these words have been selected by the editors and are not automatically chosen by machine, the number of redundant entries is kept to a minimum. However, the index does employ the spelling and terminology of the original index and their titles, so that for best results when searching the index it is important to anticipate alternative (English: US) spelling and the existence of many approximate synonyms.

The SUBJECT INDEX *contains three types of entry which are printed in various rearrangements to give the average of seven citations per abstract.*

1) Foreign titles. As in the original abstracts, these are transliterated when necessary. They are here indexed only by the first significant word, and the entire title is printed, even where this occupies two or more lines. All the lines after the first are inset, and the number of the abstract appears on the last line only. e.g.

NEOTECTONIQUE CASSANTE ET SA PLACE DANS UN ARC INSULAIRE: L'ARC EGEEN
MERIDIONAL.=LA 77P/2004

2) English titles. These are either the original title of an article in English, or the translations of the foreign title. Titles may be recognized by the fact that they end with a full stop (period) and an equals sign.e.g.

OROGENIC EVOLUTION OF AUSTRALIA.= 77P/0392

or alternatively

AUSTRALIA.= OROGENIC EVOLUTION OF 77P/0392

3) Groups of keywords (usually from 2-8 in number). A keyword is a single word or group of words taken from the text of the abstract to supplement the title. In cases where the title is fully informative no keywords are added. Where there are two or more words forming a composite keyword they are hyphenated, and each keyword is separated from the next by a space. The end of a group of keywords is marked by an equals sign alone. e.g.

SEISMIC-RISK SITES SOURCES-OF-ACTIVITY MATHEMATICAL MODELS= 77P/1124

or alternatively

SITES SOURCES-OF-ACTIVITY MATHEMATICAL-MODELS= SEISMIC RISK 77P/1124
SOURCES-OF-ACTIVITY MATHEMATICAL-MODELS= SEISMIC-RISK SITES 77P/1124
MATHEMATICAL-MODELS= SEISMIC-RISK SITES SOURCES-OF-ACTIVITY 77P/1124

4) The title entries are indexed under every significant word in the title. Each significant word will be found in its appropriate alphabetical position and is followed by as much of the title as can be printed on one line. In very many cases the whole title will fit on one line. e.g.

CRUSTAL STRUCTURE IN THE ALPS.=MAIN FEATURES OF	77P/1912
STRUCTURE IN THE ALPS.=MAIN FEATURES OF CRUSTAL	77P/1912
ALPS.=MAIN FEATURES OF CRUSTAL STRUCTURE IN THE	77P/1912

5) Where the title is too long the line is filled with what will fit in:

MANTLE STRUCTURE OF THE CAUCASUS AND THE CARPATHIANS ON THE BASIS OF S	77P/1473
STRUCTURE OF THE CAUCASUS AND THE CARPATHIANS ON THE BASIS OF SEISMIC	77P/1473
CAUCASUS AND THE CARPATHIANS ON THE BASIS OF SEISMIC DATA.=UPPER MANTL	77P/1473
CARPATHIANS ON THE BASIS OF SEISMIC DATA.=UPPER MANTLE STRUCTURE OF TH	77P/1473
SEISMIC DATA.=UPPER MANTLE STRUCTURE OF THE CAUCASUS AND THE CARPATHIA	77P/1473

The keywords are reordered in the same way, and every keyword will be indexed and followed by the other keywords for that abstract within the room available on the line. The context of adjacent keywords will narrow search to relevant articles, e.g. by identifying the relevant geographical area. In this connection it should be noted that virtually all the geographical names in the abstracts have been indexed, however obscure they may be. The commonest countries have not been indexed - these are in any case covered in the regional index which appears at the end of this volume. Subdivisions of countries (e.g. states in the USA and counties in England) have been indexed. North and South similar adjectives have been indexed where they are part of a proper name, thus North Dakota, but not north New York.

Considerable discretion has been exercised in indexing common elements such as geophysics, tectonics and so on, but these terms are indexed where they are a critical element in the title of the abstract.

Where the first 20 letters (including any spaces) of an entry are the same as those of the line above, they are omitted from the index, allowing the eye to move to the right and inspect the remainder of the line. For example:

UNDERGROUND EXPLOSIONS FROM EARTHQUAKES.= PLATE TECTONICS AND THE DISC	77P/0198
N FROM TELESEISMIC OBSERVATIONS.=DETERMINATION OF	77P/0271
NS.=THE COMPOSITION OF P WAVES FROM	77P/1238
NS FROM EARTHQUAKE.= PLATE TECTONICS AND THE DISCR	77P/1317

The AUTHOR INDEX *needs little further comment. It is a simple alphabetical listing of all the authors with some additional information to speed search for particular articles. Thus the author's name is followed by the date of the publication and the first 30 characters of the title. This is printed in the original language (transliterated if necessary) but in a few cases (notably Chinese and Japanese) the English translation of the title is given with the language indicated by a two letter key. This language indicator appears between the date and the title.*

Articles written by more than one author have the other authors listed as far as space allows, and then the later authors are listed separately followed by (2), (3), etc., signifying their place in the sequence. In a few cases there is not a list of all authors but the first author is listed, followed by 'and others.' Cross references are given for authors with prefixes, e.g. Van Andel will be found under both V and A.
